

Same-input forecast interaction: D = cross + remainder

◆ Loss factorial D ● Quadratic cross ■ Nonadditive remainder

BF16

FP32

Different y-scales. Remainder already includes output-interaction q^2 .

Wall D: aggregate only, no CI. Other intervals: marginal paired 95%.

No PointMaze or FP32 Wall source. This is not a success factorial.

Precision-specific fits and doses preclude a precision-causal claim.
